Residual modelling

SCHEMATIC

Per-compound model

$R \sim D + \text{lineage}$

Residual

$E = R - \widehat{R}$

Higher E:
more sensitive

Pairwise Spearman correlations

SCHEMATIC

A–B: same target

A–C: different targets

Within target t
$W_t = \text{median}(\rho_{AB})$

Across target t
$C_t = \text{median}(\rho_{AC})$

$$\Delta_t = W_t - C_t$$

Overall effect: $\text{median}_t(\Delta_t)$
