a Cross-screen correspondence

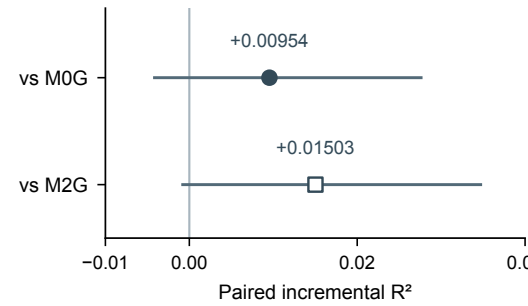

Frozen medians: 0.124 vs 0.016

† Additional FKBP1A pair outside focal groups.

Descriptive association; pairs share compounds.

b Incremental predictive performance

M1G: same-target donor + D + lineage + G

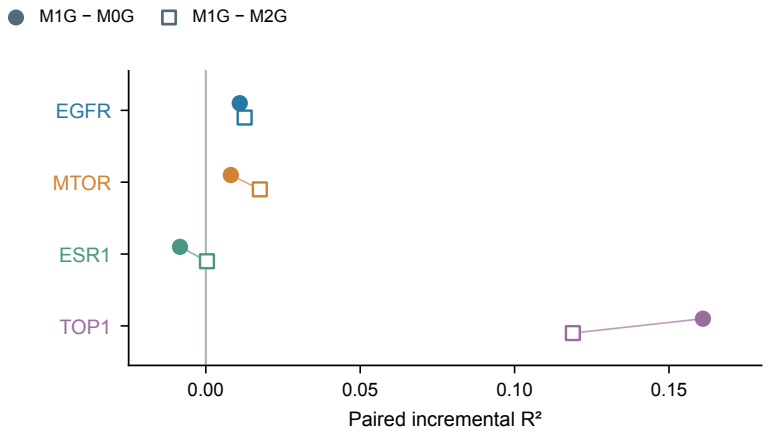

22 tasks · 11 recipients · 4 targets · 5-fold OOF

95% conditional paired-cell bootstrap CI

Overall support criterion not met

Baseline gain < 0.01; both intervals cross zero.

c Target-specific estimates of predictive gain

		Paired ΔR²	
	Tasks	vs M0G	vs M2G
EGFR	6	+0.01099	+0.01257
MTOR	12	+0.00810	+0.01748
ESR1	2	-0.00837	+0.00037
TOP1	2	+0.16100	+0.11887

TOP1: two reciprocal irinotecan–topotecan tasks; exploratory, context-limited signal.

Gains are medians of paired task increments, aggregated within recipient and target; no target-level CIs are shown.

Prediction uses measured GDSC2 donor responses in test cells. The recipient drug is observed during training.

Same-drug benchmark: Supplementary Figure Sy; available-B subsets, potentially different training samples.
